DEPLOYMENT JOURNEY & PERSONA LENS

Agent 365 — From Build to Governance

Every AI agent, regardless of how it was built, converges on the same governance layer. This diagram shows the build paths, what Agent 365 does in the middle, and what it means to each role in your organisation.

01 — THE JOURNEY

LAYER 1 — HOW THE AGENT IS BUILT

PATH 01

Copilot Studio

Low-code / no-code. Fastest to deploy for business users. Power Platform governed.

TOOLS & SERVICES

Copilot Studio · Power Platform · Dataverse · AI Builder · Power Automate

JOURNEY

1. Design agent in Copilot Studio canvas
2. Configure topics, actions, connectors
3. Publish to Teams / M365 Copilot
4. Auto-appears in Admin Center registry
5. Run `a365 setup` for full governance

PATH 02

Azure AI Foundry

Pro-code on Azure. Full model flexibility. Requires CLI for full governance stack.

TOOLS & SERVICES

AI Foundry Portal · Azure OpenAI · Prompt Flow · Azure Container Apps · Managed Endpoints

JOURNEY

1. Build agent in AI Foundry portal or SDK
2. Deploy to Azure (Container App / App Service)
3. Run `a365 config init` + `a365 setup all`
4. Run `a365 deploy` + `a365 publish`
5. Blueprint + Agentic User provisioned in Entra

PATH 03

1st & 3rd Party Agents

Pre-built Microsoft or ISV agents. Plug into M365 via Agent Store or IT provisioning.

EXAMPLES

GitHub Copilot · Dynamics 365 · Adobe · SAP · ServiceNow · Workday

JOURNEY

1. IT admin discovers agent in Agent Store
2. Reviews permissions & data access policy
3. Approves and deploys tenant-wide or scoped
4. Agent appears in Admin Center registry
5. Defender begins monitoring automatically

PATH 04

Agent SDK / OSS

Maximum control. Custom Python/Node/C#. Full Agent 365 SDK integration. The demo path.

TOOLS & SDKS

Agent 365 SDK · M365 Agents SDK · LangChain · Semantic Kernel · OpenAI SDK · a365 CLI

JOURNEY (YOUR DEMO PATH)

1. Write agent code with `AgentApplication`
2. Integrate SDK: OTel + Prompt Shields + MCP
3. `a365 config init` → `a365 setup all`
4. `a365 deploy` → `a365 publish`
5. Full 5-pillar governance active

ALL PATHS CONVERGE HERE

GOVERNANCE CONVERGENCE LAYER

Microsoft Agent 365

Identity · Observability · Security · Interoperability · Registry — for every agent, regardless of how it was built

Registry
Central inventory. Blueprint in Admin Center. Ownerless detection.

Access Control
Entra Agent ID. Agentic User UPN. Least-privilege. Zero secrets.

Visualization
OTel spans. App Insights. Invocation dashboard. Trace per call.

Interoperability
MCP servers. Outlook, Teams, SharePoint. A2A protocol. ISV ecosystem.

Security
Prompt Shields. Defender AI. Purview DLP. Human sponsor chain.

Developer · Agent Dev · IT Admin · Security Ops · End User

LAYER 3 — WHAT IT MEANS TO EACH ROLE

App Developer

"I build software that uses or hosts agents."

WHAT CHANGES FOR ME

- Add Agent 365 SDK to existing app — no rearchitecting
- Swap API keys for Managed Identity auth
- OTel traces appear automatically — no custom logging
- Bot Framework → CloudAdapter handles Teams delivery

MY DEPLOYMENT TOUCHPOINTS

- Configure `a365.config.json` once
- `a365 deploy` pushes code to App Service
- CI/CD pipeline via GitHub Actions or Azure DevOps

Key question answered

"How do I make my agent enterprise-ready without rebuilding it from scratch?"

Agent Developer

"I design agent logic, tools, and behaviour."

WHAT CHANGES FOR ME

- Use Agent Framework's `@tool` decorator — auto schema generation
- MCP servers replace custom API wrappers for M365
- Prompt Shields run pre-LLM — no manual sanitisation logic
- BaggageBuilder tags every span with agent identity

MY DEPLOYMENT TOUCHPOINTS

- Write agent logic against Agent Framework SDK
- Define tool set and MCP server permissions in Blueprint
- `a365 publish` registers agent in Admin Center

Key question answered

"How do I give my agent real M365 tool access without managing credentials or writing plumbing code?"

IT Admin

"I govern what agents exist and what they can touch."

WHAT CHANGES FOR ME

- Single Admin Center view: all agents, all build paths
- Approve or block agent deployments before they go live
- Set MCP server scopes per agent Blueprint
- Ownerless agent queue: assign sponsor or quarantine

MY DEPLOYMENT TOUCHPOINTS

- Review Blueprint request from developer
- Activate or reject in Admin Center (agents/all)
- Set conditional access policy for agentic users

Key question answered

"How do I see and control every AI agent in my tenant — including the ones IT didn't build?"

Security Operator

"I detect threats and enforce policy on agent activity."

WHAT CHANGES FOR ME

- Defender AI ingests agent OTel spans automatically
- Prompt Shields surface attack attempts in Defender alerts
- Every agent has a human sponsor — clear accountability chain
- Purview DLP blocks sensitive data in agent prompts

MY DEPLOYMENT TOUCHPOINTS

- Review `managerEmail` (sponsor) on new Blueprint requests
- Set DLP policies scoped to agentic user identities
- Triage Defender AI alerts in Sentinel / Defender portal

Key question answered

"How do I detect and respond to AI agent threats without building custom SIEM pipelines?"

End User

"I use agents in my daily Microsoft 365 workflow."

WHAT CHANGES FOR ME

- Agent appears in Teams people search with a photo and title
- @mention the agent in a channel like a colleague
- Agent shows up in Copilot Chat agent store
- Agent has a mailbox — I can forward emails to it

MY DEPLOYMENT EXPERIENCE

- IT admin enables agent — I just see it appear in Teams
- No install, no API keys, no setup required
- I know a human manager is accountable for it

Key question answered

"Is this agent safe to use, and can I interact with it the same way I do with my colleagues?"

BUILD PATH	REGISTRY	ACCESS CONTROL	VISUALIZATION	INTEROPERABILITY	SECURITY	HOW TO ACTIVATE FULL GOVERNANCE
Copilot Studio	✓ Auto via Power Platform admin	Partial — Power Platform RBAC only, no Entra Blueprint without CLI	Partial — built-in analytics, not OTel-native	✓ Native M365 connector ecosystem	Partial — Prompt Shields via Content Safety plugin	Run `a365 setup all` + `a365 publish` on top of CS agent endpoint to add Entra Blueprint, agentic user, and full OTel
AI Foundry	Manual — requires `a365 publish`	✓ Full via `a365 setup all` — Blueprint + Agentic User + Managed Identity	✓ Full via Agent 365 SDK OTel pipeline	✓ MCP servers via Agent Framework	✓ Full Prompt Shields + Defender via SDK	Complete path: `a365 config init → setup all → deploy → publish`
1st & 3rd Party	✓ Auto when installed from Agent Store	✓ Vendor manages identity; IT approves scopes	Partial — vendor telemetry may not be OTel-native	✓ Vendor integrations pre-built	Partial — Defender monitors via Entra signals; Prompt Shields vendor-dependent	IT Admin reviews in Admin Center → Copilot → Agents → All Agents, assigns sponsor
Agent SDK / OSS	✓ Full — Blueprint via `a365 publish`	✓ Full — Entra Agent ID + Agentic User + Managed Identity + FIC	✓ Full — BaggageBuilder + AgentFrameworkInstrumentor + App Insights	✓ Full — MCP servers + A2A + custom tool registry	✓ Full — Prompt Shields + structured Defender audit logs + Purview DLP	Complete path — all 5 pillars. This is your weather demo. Best for demos and enterprise custom agents.

CHOOSE THIS IF…

"Business users need to build agents without writing code"

Your agent is driven by business logic, Power Automate flows, or existing Dataverse data. The team has citizen developers. Speed to production is more important than full customisation. Governance via Power Platform admin center is acceptable.

→ Copilot Studio

CHOOSE THIS IF…

"We need custom models, RAG pipelines, or complex orchestration on Azure"

Your agent needs fine-tuned models, vector search, or Azure-native services. You have pro-code developers but want a portal-driven workflow. Full Agent 365 governance is required but you want managed infra.

→ Azure AI Foundry

CHOOSE THIS IF…

"We want to adopt proven agents from Microsoft or ISV partners quickly"

You don't need to build from scratch. Microsoft or partner agents cover your use case. IT governance is via Agent Store approval workflow. You still get Defender monitoring and Admin Center visibility with minimal IT effort.

→ 1st / 3rd Party Agents

CHOOSE THIS IF…

"We need full control, any framework, complete 5-pillar governance, or are demonstrating Agent 365 capabilities"

You are building a custom enterprise agent or a customer demo. You need all five pillars active and demonstrable. Your team is comfortable with Python / Node / C# and Azure CLI workflows. This is the **weatheragent365 demo path**.

→ Agent SDK / OSS
